

Current and future trends in climate space in the Nez-Perce & Clearwater National Forests

Healy Hamilton

Stephanie Auer

Matt Kling

Objective: To support climate change adaptation planning in NPCWNF by analysis and visualization of current and projected trends in seasonal climate variables

Types of questions to address:

Is a signal of climate change already observable?

If so, what is the spatial and temporal nature of change?

How does current change compare to modeled future projections?

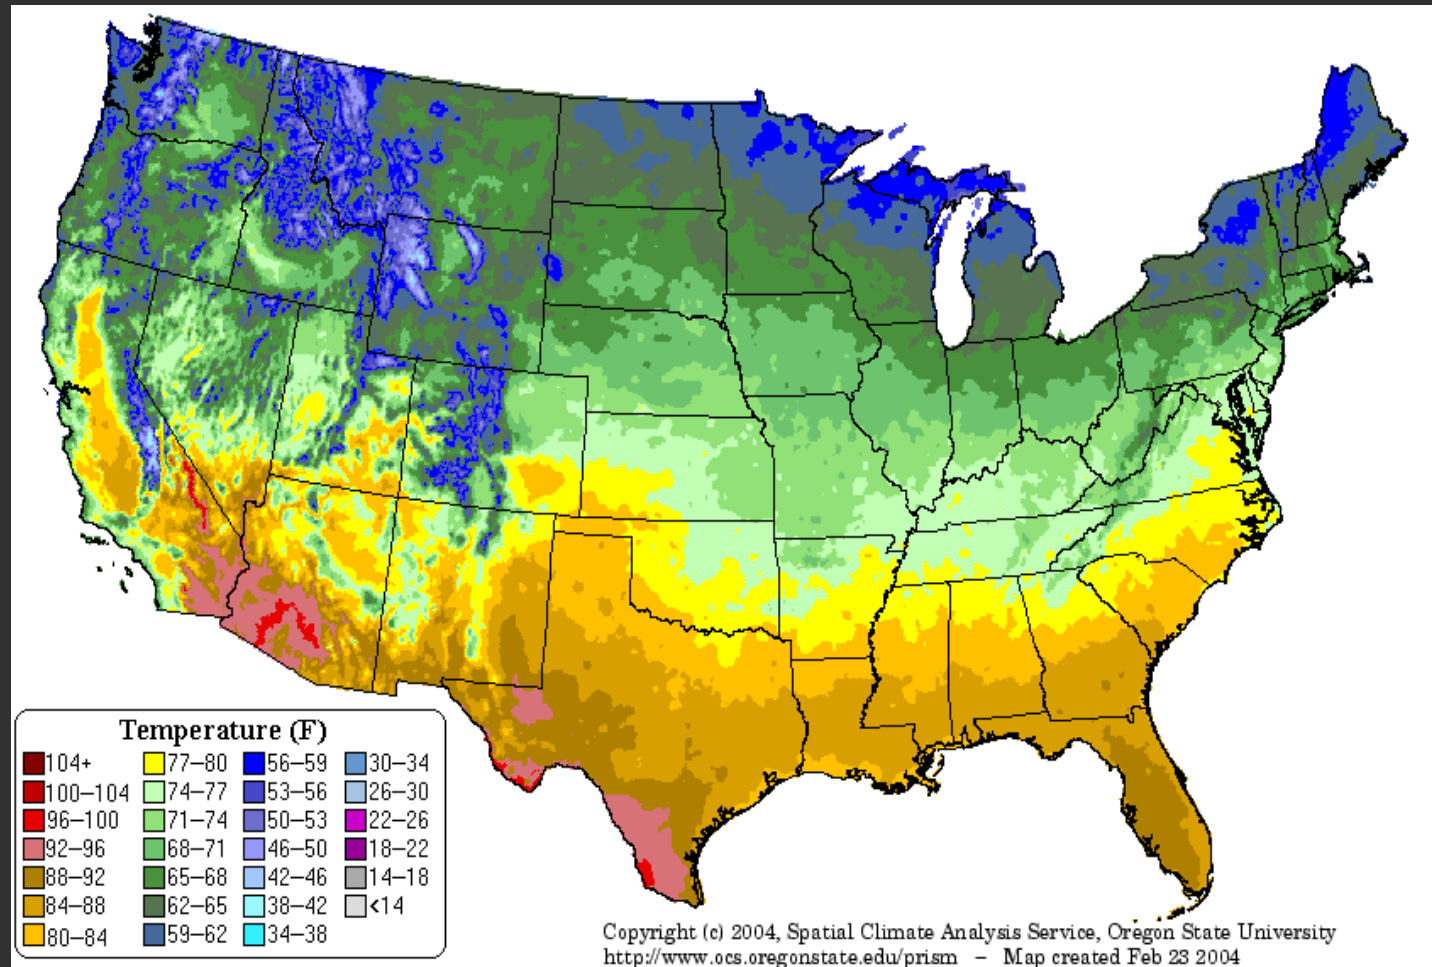

How do current and projected trends compare to historic climatic variability to which current NPCWNF resource management is already adapted?

Where are the areas currently demonstrating climatic stability, and where is climate changing most?

PRISM Spatial Climate Datasets

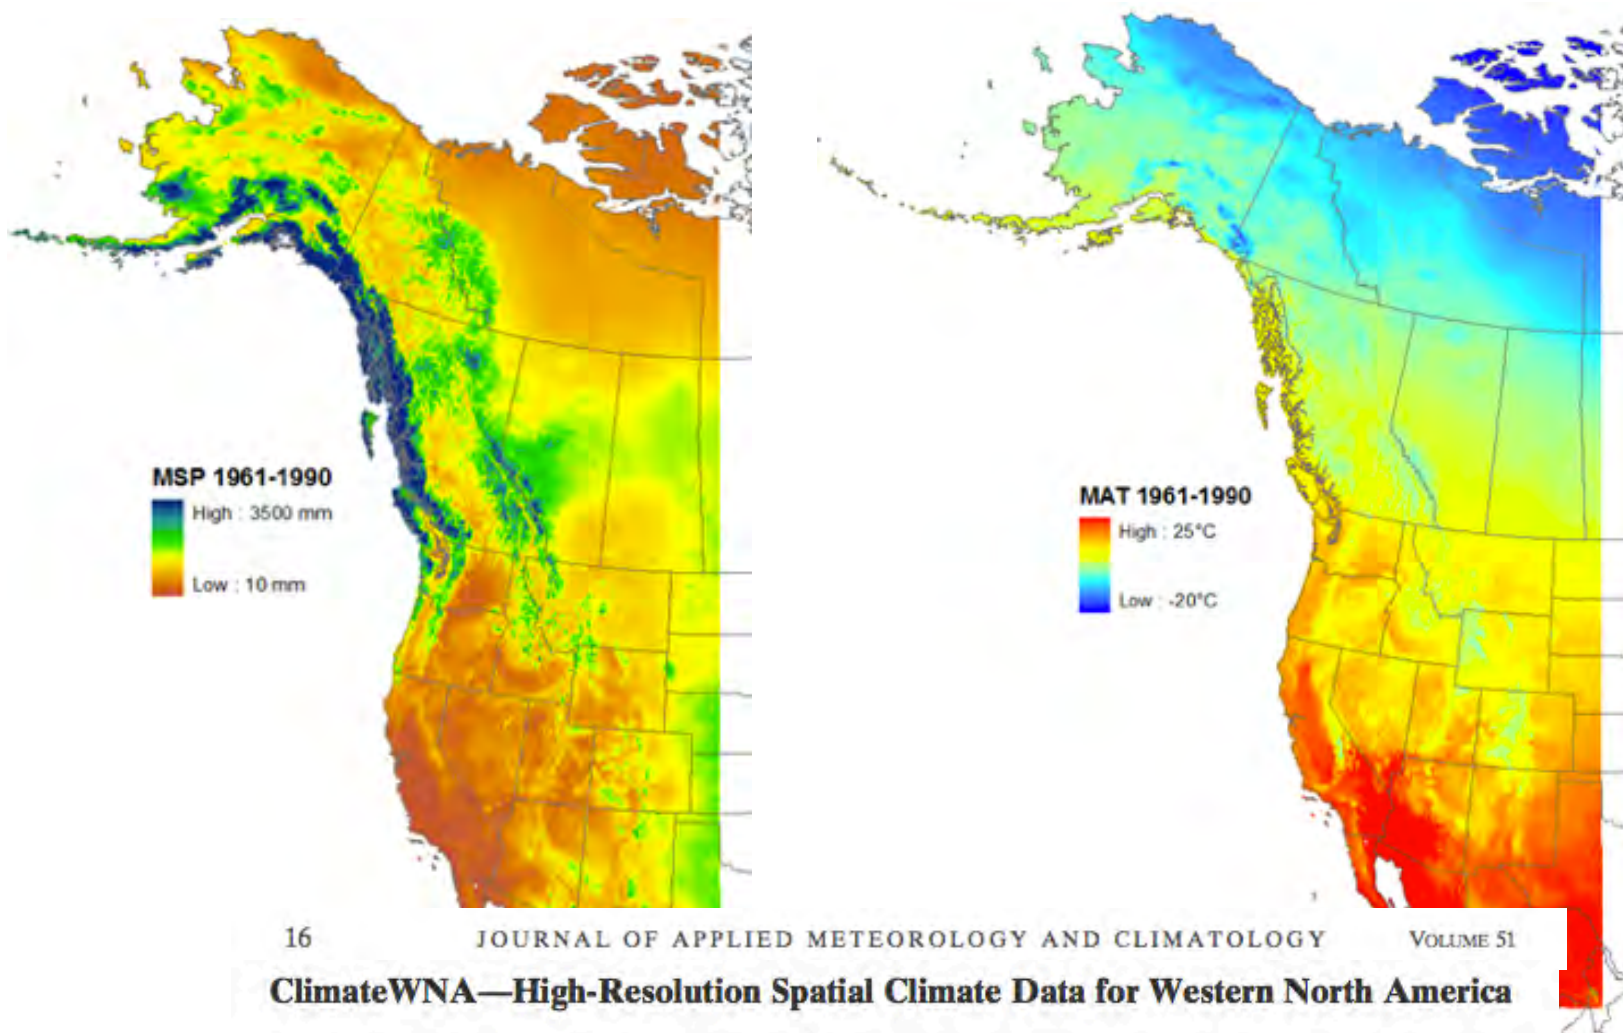

- Physiographically sensitive mapping
- Official climate datasets of the USDA
- 800-m and 4-km resolutions
- Monthly tmin, tmax, precip
- Widely used 30 yr climatologies (1971-2000, 1981-2010)

ANDREAS HAMANN

Current trends in climate space

Dataset: PRISM, 800m resolution

Variables: Seasonal tmin, tmax, precip

Time slices:

Baseline = 1901-1980

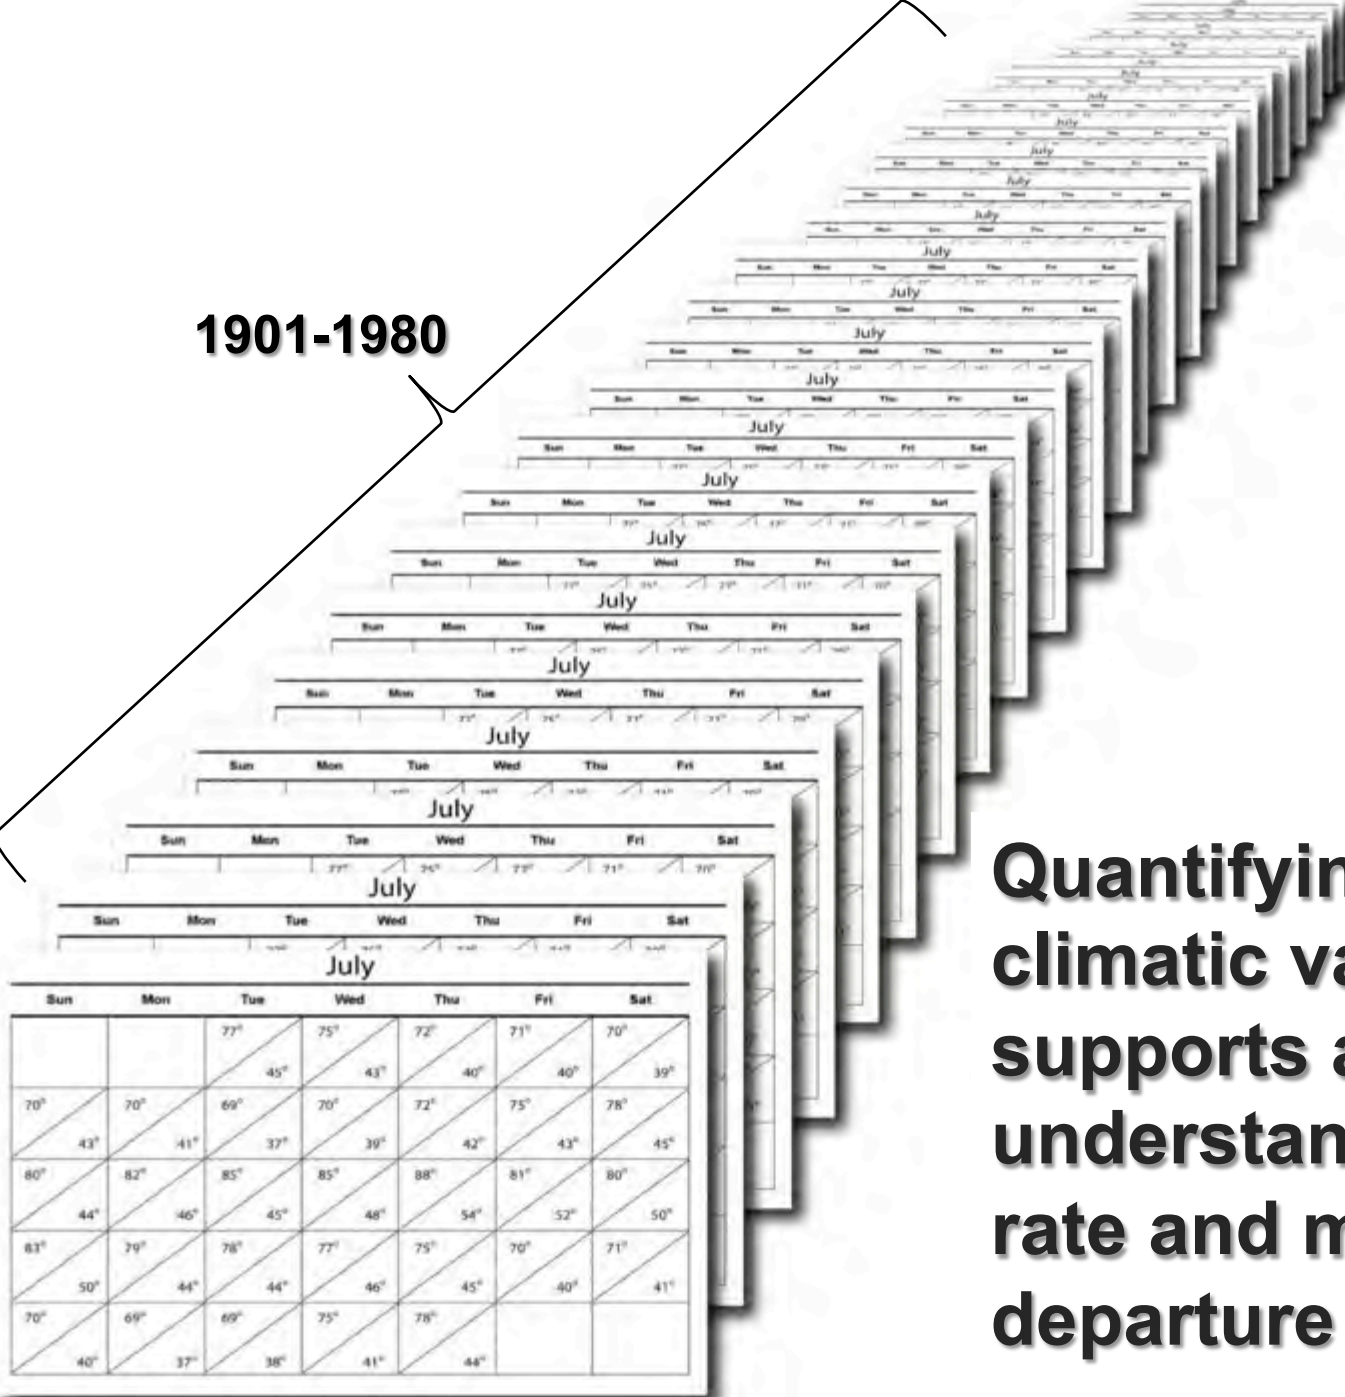

Current = 1981-2011, 1991-2011, 2001-2011

Analyses:

Per pixel deltas between current and baseline

Per pixel departures from range of historic variability

1901-1980

Quantifying historical climatic variability supports an understanding of the rate and magnitude of departure from “normal”

July maximum and minimum temperature
(-115.261, 46.99)

July maximum and minimum temperature (-115.261, 46.99)

Future trends in climate space

Dataset: Climate Western North America, 4km resolution

Variables: Seasonal tmin, tmax, precip, annual tmean, annual climatic moisture deficit (CMD)

Time slices:

Baseline = 1961-1990

Future = 2041-2070

GCMs – 7 GCM average for tmean & precip

3 GCM average for tmin, tmax, and CMD

Emission scenario = A1B

Analyses:

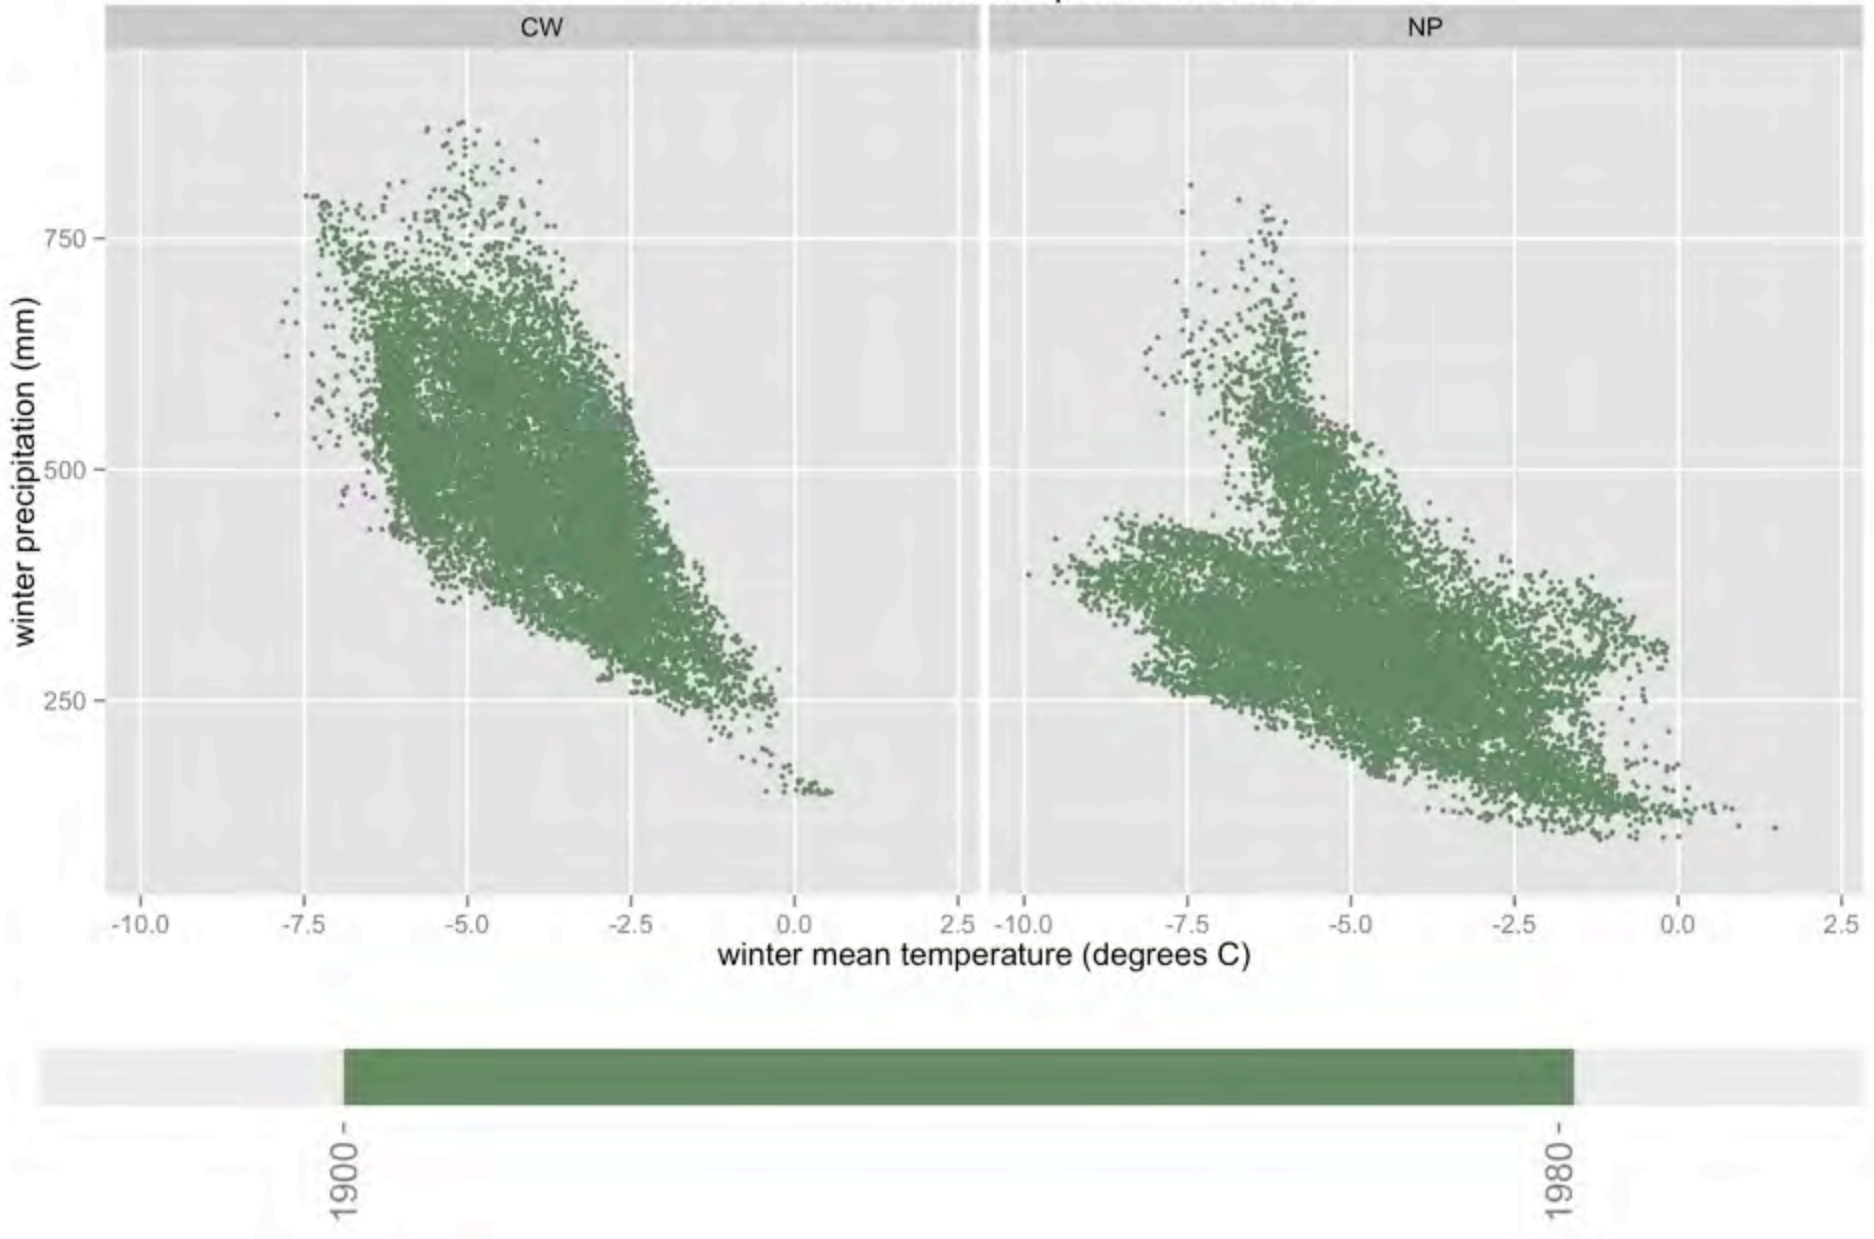

Per pixel deltas between baseline and midcentury future

Per pixel departures from range of historic variability
