Overview

During a two-day workshop in January 2016, southern California resource managers and regional stakeholders discussed fire and fuels management goals and core activities, highlighted priority climate change vulnerabilities that could affect the ability to achieve goals, and identified adaptation strategies and actions that reduced highlighted vulnerabilities. Adaptation strategies and actions identified included those currently being implemented as well as new actions prioritized for future implementation. Managers and stakeholders then developed implementation action plans for some adaptation strategies identified as future priorities.

Fire and Fuels Management Goals and Core Activities¹

1. **Restore natural fire regimes to the landscape**
   a. Restore ecosystem health
   b. Prevent stand-replacing fire in montane conifer and oak woodlands
   c. Reduce fire frequency by increasing patrols, reducing fuels (focusing first on the immediate vicinity of buildings and then expanding out), engaging a fire-safe council, and increasing education/outreach activities

2. **Prevent major erosion events and sedimentation** that can result from stand-replacing fire
   a. Use fire prevention strategies (see above)
   b. Increase land use planning and collaboration with watershed agencies and organizations

3. **Protect sensitive habitats** (e.g., Big-cone Douglas fir, old growth chaparral stands)
   a. Identify high-value areas (e.g., sites that haven’t burned recently, areas that burned and are now in recovery)
   b. Strategically reduce fuels in high-value areas
   c. Include information about actions and prioritized high-value areas in fire management plans
   d. Include information about sensitive habitats in the incident commander briefings given during a fire

4. **Promote post-fire recovery and restoration of natural vegetation communities**

5. **Improve fire resilience/resistance and fire safety of communities**

6. **Avoid placing infrastructure in high-hazard areas** by utilizing land use planning

Managers and stakeholders identified how these fire and fuels management goals and core activities may be vulnerable to climate change or other factors, and then identified potential adaptation responses. Climate and non-climate vulnerabilities and corresponding adaptation strategies and actions for these management goals are described below in Table 1.

¹ The management goals and core activities listed are not comprehensive.
Table 1. Priority vulnerabilities and associated priority adaptation responses for fire and fuels management goals.

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Altered fire regimes due to increased drought, increased temperature, precipitation changes, reduced snowpack, and beetle outbreaks, all of which affect fuel and soil moisture. Altered fire regimes may lead to:</td>
<td><strong>Strategy #1:</strong> Reduce ignition sources, especially those close to communities</td>
</tr>
<tr>
<td></td>
<td>o Extended fire seasons, which may decrease likelihood of effective suppression and increase resources needed (e.g., money, contractors, firefighters, water)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o Increased fire intensity and severity (stand-replacing), which may increase erosion and decrease the likelihood of management success</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o Changing definition of a 'natural fire regime' for the purposes of restoration, which would require managing for the future rather than the past</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Other Vulnerabilities:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Increasing human populations may lead to:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o More sources of ignitions</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o Greater impacts from ignitions that occur, affecting community safety and the</td>
<td></td>
</tr>
</tbody>
</table>

**Current/Future Actions:**
- Increase or rethink recreation restrictions and guidance
- Install k-rail barriers near major roads and high-ignition areas to stop road ignitions from spreading
- Implement closures
- Work with power companies to take preventative action (e.g., shut down power lines during high wind events)
- Improve land use planning at the county level
- Increase investments in outreach and education

**Strategy #2:** Use fire suppression treatments, choosing treatments that will provide the greatest benefit to natural resources

**Current/Future Actions:**
- Train firefighters to handle changes in fire behavior
- Use fire hazard/risk maps to provide more real-time information on triage needed in key areas
- Increase reliance on mechanical fuel treatments rather than prescribed fire
- Use rapid response remote sensing to monitor ignition sources in sensitive areas
- Increase water source development, water capacity, and access to water in multiple locations
- Identify locations where Threatened & Endangered Species (TES) restrictions may impact water use and adjust actions as necessary
- Educate and collaborate with others to better understand how resources may benefit from fire suppression activities
- Increase public education on actions for individual protection from wildfire

**Strategy #3:** Increase treatment effectiveness

<tbody>
<tr>
<td>• Improve fuelbreaks by focusing the use of limited resources in strategic locations (i.e., prioritize places that will be highly effective in the face of climate change)</td>
<td>• Identify and protect sensitive, high-risk, and/or high-value sites</td>
</tr>
<tr>
<td>• Increase reliance on mechanical fuel treatments, rather than using prescribed fire</td>
<td>• Mark these sites as places to drop retardants</td>
</tr>
<tr>
<td>• Identify a method for removing larger amounts of biomass, rather than depending on prescribed fire to remove downed biomass</td>
<td>• Build new fire stations in key areas and make sure that resources are available</td>
</tr>
<tr>
<td>• Focus on removing fine fuels, and avoid using treatments that may increase these fuels</td>
<td>• Add patrols in key areas</td>
</tr>
<tr>
<td>• Seek alternative funding sources to support treatments</td>
<td>• Map dieback to identify risk areas</td>
</tr>
<tr>
<td>• Require local landowners to treat their land in order for surrounding federal lands to be treated</td>
<td>• Better incorporate Resource Advisors into fire treatment activities (prescribed fire, suppression)</td>
</tr>
<tr>
<td>• Collaborate across agencies and work with community groups to increase enforcement and/or incentives for people to treat their private properties within the wildland-urban interface (WUI)</td>
<td>• Identify a clear goal for each site</td>
</tr>
<tr>
<td>• Retrofit community structures in addition to treating fuels, taking advantage of FEMA disaster grants (for example, Big Bear and Idyllwild projects)</td>
<td>• Provide specific information about actions and locations in fire management plans (e.g., some sites may need to be burned while others should be protected for certain intervals), and update plans and site-specific information annually</td>
</tr>
<tr>
<td>• Increase long-term maintenance of fuel treatments, and only carry out treatments that have funding/commitment for long-term maintenance</td>
<td>• Strategically reduce fuels around these areas</td>
</tr>
<tr>
<td>• Strategically reduce fuels around these areas</td>
<td>• Ensure that Incident Commanders receive information about sensitive, high-risk, and/or</td>

### Strategy #4: Identify and protect sensitive, high-risk, and/or high-value sites

- **Current/Future Actions:**
  - Mark these sites as places to drop retardants
  - Build new fire stations in key areas and make sure that resources are available
  - Add patrols in key areas
  - Map dieback to identify risk areas
  - Better incorporate Resource Advisors into fire treatment activities (prescribed fire, suppression)
  - Identify a clear goal for each site
  - Provide specific information about actions and locations in fire management plans (e.g., some sites may need to be burned while others should be protected for certain intervals), and update plans and site-specific information annually
  - Strategically reduce fuels around these areas
  - Ensure that Incident Commanders receive information about sensitive, high-risk, and/or...
### Strategy #5: Focus on resilience rather than restoration of a particular fire regime

**Current/Future Actions:**
- Define resilience goals (e.g., carbon storage, native diversity, nutrient and water cycling)
- Encourage acceptance of novel communities and focus on the services that they provide rather than what they used ‘to be’
- Restructure the fire organization to focus on the whole year rather than just gearing up for the suppression season, in order to allow more prescribed fire and restoration activities
- Revisit baseline fire return intervals with the assumption that pre-European intervals may no longer be an appropriate target

Adaptation Implementation Action Plan

Managers and stakeholders developed implementation action plans for some of the identified priority adaptation strategies in Table 1. These plans include a list of sequential steps needed to successfully implement the adaptation strategy, and identification of potential implementation barriers and potential solutions.

Adaptation Strategy
Incorporate climate and fire vulnerability into fire management plans; update fire management plans with climate and other stressor information.

Implementation Plan (actions listed in order of occurrence)
1. Identify and map valued resources at risk, most vulnerable sites, and high-value sites
   a. Gather fine scale spatial information and identify gaps in spatial information (FRID, climatic water deficit projections, species distribution)
2. Set clear goals for each location and site
   a. Acknowledge change and set potential trigger points for when new goals need to be developed (e.g. if conifer site converts to shrubs, may want to alter goals rather than fight to get trees back)
3. Identify actions/strategies to achieve site goals; for example:
   a. Protect key areas by reducing vulnerability of suppression activities
      i. Potentially mark areas as retardant drop sites
      ii. Build new fire stations in key locations
      iii. Add patrols in key areas
      iv. Make sure resources are available in key areas
   b. Determine risk/benefit of fire at various stages (e.g. if XX has burned within the last X years, and is sensitive to short return intervals, keep fire out for XX more years OR allow fire in areas that need it)
   c. Reduce fuels in strategic areas around these sites
      i. Rely more on mechanical treatments than fire (less constrained)
      ii. Find solutions to allow the removal of more biomass, rather than relying on prescribed fire to remove downed biomass
      iii. Seek alternative funding sources
      iv. Communicate with local land owners that they must treat their land or the Forest Service will not treat complementary public land
   v. Collaborate across agencies and work with community groups to increase enforcement and/or incentives for people to treat their own land within the WUI
   vi. Retrofit community structures to better tie with vegetation treatments because one is not effective without other; take advance of FEMA disaster grants
   vii. Focus on fine fuels and avoid treatments that increase fine fuel components
viii. Increase long-term maintenance of any treatment, and only implement treatments that have commitment/funding for long-term maintenance

4. Get specific information about actions and locations into annual plan updates
   a. Have USFS staff populate Wildland Fire Decision Support System (WFDSS) during annual data call

5. Ensure that specific information about actions and locations is then included in the information given to firefighters and advisors on any given fire in any given location; train firefighters to benefit these particular resources
   a. Prepare/train fire fighters for very different fire behavior
   b. Use appropriate suppression response tactics to enhance benefits to natural resources (especially in sites identified above)
   c. Collaborate (and educate collaborators) to better understand how resources benefit from suppression activities
   d. Engage in water source planning and preparation
      i. Increase water source development, water capacity, and access to water in many spots, especially in high-risk or high-value sites
      ii. Identify where TES restrictions will impact water use and the best ways to adjust
   e. Use rapid response remote sensing monitoring for ignition sources in sensitive areas
   f. Increase the real-time component of fire hazard/risk maps to provide immediate information to firefighters on triage needed in key areas

Challenge/Barriers to Implementation and Possible Solutions

- Challenges: Scale (need fine scale information), uncertainty, public and institutional support, funding, lack of monitoring, lack of understanding of larger resource context by firefighters, not getting invited to the WFDSS/plan update meetings, cross-jurisdictional activities (e.g., activities on state and private lands), poor data storage and communication across agencies
  - Solution: Garner/Facilitate public support through collaborative projects (e.g., agencies involved in Natural Community Conservation Planning (NCCP))
  - Solution: Change institutional/operational mind-frame to incorporate information before or during the fire
    - Train fire staff
    - Train resource staff in fire activities, and better incorporate resource advisors in fire activities
    - Incorporate local knowledge of fire staff (i.e., people that may have had many experiences in any area)
    - Adjust fire organizational structure so that they don’t ‘staff up’ right before fire, but have various priorities throughout the year
  - Solution: Establish institutional monitoring requirements/efforts that are not one-offs and are incorporated into ongoing efforts where possible
    - Incorporate ongoing long-term, large scale monitoring (e.g., FIA monitoring); collect information on microsites (e.g. soil moisture) and
collect land facet information to help determine which areas may be climate refugia or connectivity areas
- Add more FIA plots in shrubland sites
  - **Solution:** Facilitate cross-jurisdictional collaboration to get data and vulnerability information into the hands of other land managers
    - Gather organizations together for resource pre-planning communication (e.g., counties, Cal Fire, USFS)
    - Update databases
  - **Solution:** Work with USFS State & Private liaisons to help institutionalize some of these concepts in non-land management agencies/organizations
