Riparian habitats are critically sensitive to changes in the amount, source, and duration of water within a system, and habitats that rely solely on precipitation are most sensitive to changes in the amount or timing of rain and snow. Drought conditions have widespread effects on all system types, and may shift species composition towards vegetation that can tolerate drier conditions. Severe flooding can cause erosion and channel entrenchment that may alter habitat structure and function, and wildfire greatly increases the risk of flash flooding and debris flows. Climate vulnerabilities in riparian habitats are further exacerbated by habitat degradation or loss due to anthropogenic stressors.

**Habitat Description**
Southern California riparian habitats vary widely with regard to species composition, geomorphology, and hydrologic regimes. For the purposes of this assessment, discussion will be limited to vernal pools, springs, and wet meadows. These categories include both precipitation- and groundwater-dominated systems, and they are frequently characterized by a high water table, periodic flooding, hydric and/or mesic vegetation, and the presence of rare, endemic, and threatened or endangered species adapted to these habitat types.

### Drivers of Riparian Habitats
- **Climate sensitivities**: precipitation, snowpack depth, timing of snowmelt/runoff, soil moisture, low stream flows, drought
- **Disturbance regimes**: Wildfire, flooding
- **Non-climate sensitivities**: dams and water diversions, invasive species, land use conversion

### Projected Climate and Climate-Driven Changes

<table>
<thead>
<tr>
<th>Changes in precipitation and drought</th>
<th>Potential Impacts on Low-Gradient Riparian Habitats</th>
</tr>
</thead>
</table>
| Variable annual precipitation volume and seasonal pattern; longer, more severe droughts with drought years twice as likely to occur | • Changes in water quality and/or chemistry  
• Altered timing and duration of inundation in vernal pools  
• Reduced spring discharge rate  
• Extirpation of aquatic species where pools dry up |

<table>
<thead>
<tr>
<th>Decreased snowpack and earlier timing of snowmelt and peak runoff</th>
<th></th>
</tr>
</thead>
</table>
| Up to 50% reduction in snowfall and 70% reduction in snowpack by 2100 (greatest loss in low elevations); snowmelt and peak runoff occurring 1-3 weeks earlier | • Delayed or reduced groundwater recharge  
• Compositional shift towards xeric vegetation  
• Losses or compositional shifts in species that depend on spring flooding and/or cold-water habitat created by snowmelt |

<table>
<thead>
<tr>
<th>Altered stream flows</th>
<th></th>
</tr>
</thead>
</table>
| More extreme low flows and increased duration of low-or no-flow conditions; altered frequency and/or severity of flooding; 30-40% increase in flash floods in small river/stream basins | • Compositional shifts towards xeric vegetation and associated bank erosion and channel incision in meadows  
• Decreased stream connectivity, affecting aquatic species  
• Loss of salmonids due to increased water temperature  
• Decreased amphibian reproduction where habitat declines |

### Sensitivity & Exposure
- **Moderate Vulnerability**

### Factors that enhance adaptive capacity:
- Disturbance-adapted community with diverse species composition
- High structural, spatial, and functional diversity
- Cool, wet conditions can provide refugia under changing climate conditions
- Provides key ecosystem services: water supply, flood/erosion protection, and sediment transport

### Factors that undermine adaptive capacity:
- Large areas of habitat have already been lost or heavily impacted, and may not be able to recover without management intervention
- Fragmentation and upstream barriers reduce habitat connectivity and species dispersal
- Increasing water demand from urban communities may threaten springs and other sources
Adaptation Strategies for Riparian Habitats

**What kinds of adaptation options are there?**

- **Enhance Resistance** ➔ Prevent climate change from affecting a resource
- **Promote Resilience** ➔ Help resources weather climate change impacts by avoiding the effects of or recovering from changes
- **Facilitate Transition** ➔ Accommodate change and/or enable resources to adaptively respond to variable conditions
- **Increase Knowledge** ➔ Gather information about climate impacts and/or management effectiveness in addressing climate change challenges
- **Engage Collaboration** ➔ Coordinate efforts and capacity across landscapes and agencies

<table>
<thead>
<tr>
<th>Adaptation Category</th>
<th>Adaptation Strategy</th>
<th>Specific Management Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enhance Resistance</td>
<td>Preserve native riparian habitat and maintain habitat connectivity</td>
<td>• Establish wilderness areas, focusing on intact riparian habitat • Use vegetation to increase shading of riparian habitat and maintain cool, wet areas¹</td>
</tr>
<tr>
<td></td>
<td>Manage grazing to reduce impact on riparian habitat</td>
<td>• Build livestock exclosures to protect riparian habitats that are easily damaged by grazing² • Implement moderate grazing around vernal pools to maintain vernal pool hydrology²</td>
</tr>
<tr>
<td>Promote Resilience</td>
<td>Identify and restore key ecosystem functions</td>
<td>• Restore floodplain function by establishing setbacks, stabilizing banks and headcuts, and employing plug-and-pond techniques to support current and future hydrology</td>
</tr>
<tr>
<td></td>
<td>Increase habitat heterogeneity to support species diversity</td>
<td>• Enhance breeding sites by providing microhabitat structure (e.g., woody debris) for nesting and egg deposition</td>
</tr>
<tr>
<td>Facilitate Transition</td>
<td>Support species’ survival under changing conditions</td>
<td>• Focus amphibian conservation activities in areas identified as climate refugia and/or areas that may be suitable habitat in the future</td>
</tr>
<tr>
<td>Increase Knowledge</td>
<td>Prioritize the protection of riparian habitat and monitor the effects of changing climate conditions</td>
<td>• Map riparian habitat, climate trends and 50-year climate projections, surrounding native vegetation, and historical species ranges</td>
</tr>
<tr>
<td>Engage Collaboration</td>
<td>Improve overall watershed health</td>
<td>• Develop partnerships with university programs that focus on hydrology, groundwater, and/or watersheds • Incorporate boardwalks and educational features to offer the public information about watershed health</td>
</tr>
</tbody>
</table>

*Actions presented are those evaluated as having higher effectiveness and/or feasibility.

**Management Implications**
